Knowledge Base Article: Mnemonic name mismatch

Incident ID: INC2881482

Issue:

When there is a mnemonic name that contains a comma (,) then the range request operation in ETP does not work.

Problem Description:

When there is a mnemonic name having a comma (,) then the range request operation in ETP does not work. The current version of ETP does not support comma in the mnemonic naming convention.

Workaround:

To match the ETP store with soap store we need to follow the below steps:

1. **Remove the comma from the mnemonic name:**
 - Open PDT from Insite VM and edit the mnemonic name.
 - Remove the comma from the mnemonic name and save PDT.
 - Republish the PDT dataset.
2. **Verify the Changes in RTS API and SOAP:**

Using the postman application send a large query request for the log and verify that the change made in step one is reflected. If yes, open PDS and verify the same in SOAP.
3. **Verify in ETP:**

- Open PDS and copy the log url to streaming.
- Do start, Describe and select the mnemonics and select Time/Depth index.
- Give the min and max value.
- Do the range request operation.
- Now the result should be displayed.
